

XStudioz Recovery Model

*Diagnosis, operating system, and the 33-day plan
to restore visibility and reach Top Rated*

XStudioz is not a demand problem and not a conversion problem. Its click-through and order-conversion mechanics are intact and in places improving. What broke is **distribution** — impressions fell 86% between mid-April and late July while the rest of the portfolio partially recovered. This document isolates why, and specifies the system that fixes it.

The One Page

If you read nothing else, read this.

IMPRESSIONS ▾ -86% 11,092/day (Apr) to 1,564/day (Jul)	CONVERSION 12.05% Intact. Never broke. Strongest asset.	SUCCESS SCORE 8 Lowest of 11 profiles in portfolio	DEAD PIPELINE \$5,472 Quoted, never followed up, zero touches
--	---	--	---

The single sentence

Buyers who see XStudioz still buy at a high rate. Fiverr has largely stopped showing XStudioz to buyers. Every action in this document is therefore aimed at **restoring distribution and lifting Success Score from 8 to 9** — not at chasing order count.

The target is wrong, and here is the replacement

	STATED TARGET	CORRECTED TARGET
Metric	Queue depth of 60–70 by 30 Aug	Impressions and Success Score
Why it fails	At 2 orders/day, a 65-queue implies a 32-day cycle time . Your last 12-day order scored 4.7 with a written complaint.	Queue rebuilt itself to 67–80 in April with zero effort, purely because impressions were at 11,000.
30 Aug goal	65 in queue	Impressions 6,000–8,000 · Success Score 9 · Queue 40–45 · Cycle under 5 days

Queue depth is work-in-progress. WIP is inventory, not revenue. It is the one number that lies to you.

The five moves

- 1 Cancellations to zero**
 Six cancellations worth \$1,064 landed between 20 April and 8 May — the exact window the collapse began. Cancellations are one of six scored Success Score areas.
- 2 Cut inorganic share to 30% or below**
 XStudioz ran 74% in July. Dygram runs 44%, holds Success Score 9, and pulls 8× the impressions. Match the profile in your own portfolio that works.
- 3 Deliver at 60% of promised time, every order**
 Category median is 2–3 days. Your observed range is 4–12 days. On-time delivery and value-for-money are two of the six scored areas, and both of your weak public sub-ratings map to them.

4

Run the 12-question intake on every order

Delivered in order chat within 15 minutes of start, since gig requirements cannot be edited. Question 11 alone prevents the failure mode already visible in your reviews.

5

Work the \$5,472 dead pipeline and turn the follow-up engine on

Three follow-up columns exist in your sheet and have never once been filled. Nineteen named leads with quoted prices are sitting there marked "waiting response."

DO NOT DO THIS YET

No Fiverr Ads until Success Score reaches 9. Paying for clicks on a profile with suppressed organic distribution means buying your way past a penalty instead of clearing it. The ROI maths works (7–14% of net at your conversion rate) — but only once the underlying signal is repaired. Gate it.

Diagnosis

What the data says, including where my earlier read was wrong.

1.1 Profile state, 27 July 2026

DIMENSION	VALUE	READ
Level	Level 2	Two tiers of gates already cleared
Rating	4.8 across 1,583 reviews	Above the 4.7 Top Rated threshold
Success Score	8	Needs 9 for Top Rated. Lowest in portfolio.
Response time	1 hour	Strong. Shift model is working here.
Live gigs	2 + 1 new (from 20 Jul)	Level 2 permits 10. Seven slots idle.
Sub-rating — communication	4.9	Team strength
Sub-rating — quality of delivery	4.8	Drag. Maps to Success Score.
Sub-rating — value of delivery	4.8	Drag. Maps to Success Score.
Star spread	1420 / 106 / 29 / 14 / 14	57 reviews at 3★ or below (3.6%)
Observed delivery durations	4, 5, 5, 6, 12 days	Slow versus a 2–3 day category median

THE GATE

Top Rated requires Success Score 9, rating 4.7+, 40 orders, 20 unique clients, \$10,000 earned, plus a manual review. You clear rating, orders, clients and earnings comfortably. **The only binding constraint is Success Score.** That is the entire strategic problem, stated in one line.

1.2 The distribution collapse

PERIOD	AVG DAILY IMPRESSIONS	CHANGE	NOTE
15–30 April 2026	11,092	baseline	Peak 17,842 on 28 Apr
May 2026	6,104	–45%	Declined every week
June 2026	2,153	–81%	Floor 636 on 26 Jun
1–27 July 2026	1,564	–86%	Flat at the bottom

1.3 What did *not* break

MECHANIC	APRIL RANGE	JULY RANGE	VERDICT
Click-through ratio	0.94 – 1.72%	0.76 – 2.41%	Intact, trending up
Order conversion rate	2.5 – 13.5%	5.0 – 24.0%	Intact, trending up
Response time	1 hour	1 hour	Held

Gig images, pricing, copy and CSR closing ability are all performing. On 27 July the profile converted 40 clicks into 5 orders — a 12.05% conversion rate that would be strong in any logo category. **Nothing downstream of the impression is broken.** Fixing gig copy, retraining closers, or lowering prices would all be solving the wrong problem.

1.4 Correction to my earlier reading

REVISED FINDING

In our conversation I framed this as an XStudioz-specific algorithmic penalty. Running the same impression series across all eleven profiles shows that is **only partly true**. Grid Designs fell from roughly 30,000/day in January to around 800/day in late July. Eikon Designs collapsed on a similar curve. The decline through June is portfolio-wide, not profile-specific.

The real signal is **what happened in July**: Dygram and Storm recovered. XStudioz, Grid and Eikon did not. That divergence is the diagnostic event, and it is far more defensible than a single-profile penalty theory.

1.5 The control group inside your own portfolio

PROFILE	JUL AVG IMPRESSIONS	JUL INORGANIC SHARE	SUCCESS SCORE	JULY TRAJECTORY
Dygram	~12,700	44%	9	Recovered
Storm	~6,500	—	10	Partial recovery
AH2 Branding	~900	—	9	Stable
Carpicon	~600	—	8	Stable
Grid Designs	~850	—	9	No recovery
Eikon Designs	~430	—	9	No recovery
XStudioz	1,564	74%	8	No recovery

Same operator, same market, same period, eleven profiles. XStudioz carries the **highest inorganic ratio and the lowest Success Score** of the set. Dygram runs the same play at roughly half the ratio, holds a 9, and pulls eight times the impressions.

1.6 The inorganic ratio, month by month

MONTH	ORGANIC	INORGANIC	INORGANIC SHARE	AVG IMPRESSIONS
Sept 2025 (baseline)	18	0	0%	not tracked
15–30 April 2026	73	44	38%	11,092
May 2026	32	68	68%	6,104
June 2026	16	1	6%	2,153
1–27 July 2026	12	34	74%	1,564

In September 2025 XStudioz ran **zero inorganic**, every single day, while Grid and Eikon had already begun. It did 18 orders in 13 days at \$138.61 average order value, entirely organic. That is the profile's natural state and its highest average order value in the portfolio.

1.7 The cancellation cluster

DATE	CANCELLATIONS	VALUE
20 April 2026	1	\$245
30 April 2026	1	\$180
1 May 2026	1	\$350
2 May 2026	1	\$108
6 May 2026	1	\$85
8 May 2026	1	\$96
19-day total	6	\$1,064

Six cancellations in nineteen days, opening exactly as impressions peaked and immediately preceding the collapse. Your own sheet annotations attribute one to a suspected fake order, one to a client who did not understand that an editable file requires the font installed locally, and one to a mistake order. **Two of those three are preventable by the intake script in Part 3.**

HONEST LIMITATION

Correlation is not causation. Two candidate causes — the cancellation cluster and the inorganic ratio — sit in the same window, and this dataset cannot separate them. That matters less than it appears: **the remedy set for both is identical**, and both are within your control. Act on both, measure impressions weekly, and the data will tell you which mattered.

1.8 The pipeline hole

Across roughly 330 logged inquiries from January to July, the columns FollowUp, FollowUp 2 and FollowUp 3 are **empty in every single row**. "Waiting response" is the most common note in the entire log. In your process, "waiting response" means the

conversation ended there.

LEAD	COUNTRY	QUOTED	STATUS
selmaprof	UK	\$950	Waiting response
bobzinos	Qatar	\$900	Waiting response
farida_ism	Azerbaijan	\$700	Waiting response
getgwoppa	UK	\$700	Waiting response
ryan_wonders	UK	\$350	Waiting response
chupetes	Costa Rica	\$200	Waiting response
alisa_kruhle1	Netherlands	\$180	Waiting response
dgtl_depot · paulmesaric · abdulla336699	USA · AU · UAE	\$525	Waiting response
akhilkpfx · architpatel497 · thbs92	India · UK · UK	\$442	Waiting response
jeff_wilf · takes_jonny · jojolily2	NL · UK · Qatar	\$305	Waiting response
kai_utzinger · zain_qw · Mohamed L	DE · UK · UAE	\$220	Waiting response
Total recoverable pipeline		\$5,472	Zero follow-ups logged

Top Rated requires \$10,000 in earnings. More than half of that figure has been sitting untouched in a spreadsheet column.

1.9 Inquiry volume and close rate

MONTH	INQUIRIES LOGGED	PLACED	CLOSE RATE
February	63	17	27%
March	39	12	31%
April	91	25	27%
May	62	7	11%
June	20	5	25%
July	22	2	9%

DATA INTEGRITY FAILURE

On 27 July the tracker records **5 orders placed**. The inquiry log records **2 placed in the entire month of July**. Those cannot both be true. Either most orders arrive as direct orders with no logged conversation, or the inquiry log has been quietly abandoned.

Until those two numbers reconcile daily, every conversion figure in this section is unreliable and no decision should rest on it alone.

The Algorithm Model

How Fiverr actually ranks in 2026, verified against platform documentation.

2.1 What Fiverr states directly

- Search results only show freelancers **currently available to take orders**.
- Ranking combines textual relevance with popularity and buyer-satisfaction signals, driven by machine-learning models, review scores, pricing, availability and responsiveness.
- Fiverr **prioritises fast deliverers when it detects buyer urgency**.
- Pricing is itself a ranking input — Fiverr deliberately mixes price points to give buyers a comparison range.
- Positions rotate continuously. There is no fixed rank to hold.
- The Fiverr's Choice badge is assigned, not applied for, and rotates. It is a downstream effect of quality signals, never a target.

2.2 Success Score — the six scored areas

#	AREA	WHAT IT MEASURES	YOUR EXPOSURE
1	Client satisfaction	Reviews plus hidden private ratings	Quality sub-rating 4.8
2	Effective communication	Responsiveness, helpfulness, clear expectations	4.9 — strength
3	Conflict-free orders	How often disputes arise	Font-file dispute logged
4	Cancellations	Effect of cancellations on the order process	6 in 19 days
5	On-time delivery	Frequency of on-time and early delivery	4–12 day range
6	Value for money	Whether clients felt they got what they paid for	Value sub-rating 4.8

2.3 The three mechanics most sellers miss

A

The score is peer-relative, not absolute

Fiverr benchmarks you against other freelancers **in your subcategory and your price range**. You can improve in absolute terms and still fall, if the field improves faster. Logo design is one of the most saturated subcategories on the platform — which is precisely why Fiverr's own success managers recommend opening gigs in thinner subcategories to lift scores across the board.

B

Weighting is not even

Gigs with more orders carry more weight in the overall score. Within a gig, **higher-value and more recent orders hit harder**. A \$400 branding kit moves your score substantially more than a \$45 order.

C

Private ratings are invisible and heavily weighted

Twenty-four hours after the public review, buyers get an optional anonymous questionnaire: overall quality of the delivery, how closely it met expectations, whether it was useful. It can be submitted up to 60 days after completion. **First-time buyers' private ratings are weighted more heavily than repeat customers', and higher-priced, higher-volume orders carry more weight.** This is why a wall of 5-star public reviews can sit alongside a falling Success Score.

THE STRATEGIC IMPLICATION

Order volume is no longer a ranking currency. The system rewards **new buyers, at higher prices, delivered fast, with no disputes and no cancellations** — and it measures satisfaction through a channel you cannot see. Any strategy that maximises transaction count while diluting per-order value and new-buyer satisfaction is pushing against the highest-weighted signals in the model.

2.4 Level gates

REQUIREMENT	LEVEL 1	LEVEL 2	TOP RATED	XSTUDIOZ
Success Score	5+	7+	9+	8
Rating	4.4+	4.6+	4.7+	4.8
Response rate	80%	90%	90%	Met
Orders	5	20	40	1,583 reviews
Unique clients	3	10	20	Met
Earnings	\$400	\$2,000	\$10,000	Met
Gig slots unlocked	10	10	30	3 of 10 used

Evaluation runs **daily** since the 2024 overhaul, with a 30-day grace period before demotion. Promotion to Level 1 and 2 is automatic within 24 hours of qualifying; Top Rated adds a manual review. There is also a hard gate most sellers never learn about: **Fiverr's brief system only routes client briefs to services with a Success Score of 7 or higher.** At 8 you are inside that flow — losing the 8 would cut off inbound demand entirely.

2.5 Response rate mechanics

- Counts **only the first message** in each new thread. Follow-up messages inside a thread do not count.
- The window is 24 hours. The measurement is a rolling 90 days.
- Every first message counts — including spam, wrong-language messages, and requests for services you do not offer.
- **Spam does not count against you if reported as spam within 24 hours.** Most agencies bleed response rate on messages they could have flagged in three seconds.

2.6 What is myth — stop teaching these

CLAIM	REALITY
Staying online 24/7 raises ranking	Not a confirmed ranking factor. It affects the "online now" buyer filter and perceived responsiveness only. Auto-refresher tools violate Terms of Service.
Edit your gig weekly to look active	Editing restarts the evaluation window before stable data accumulates. Two edit cycles per quarter is the practical ceiling.
You can apply for Fiverr's Choice	It is assigned to selected services and rotates. Chase Success Score; the badge is a by-product.
More gigs of the same service means more coverage	Duplicate gigs offering the same service are removed. Different subcategories are the legitimate route.
Public 5-star reviews mean you are safe	Private ratings run underneath and are weighted more heavily for new buyers and large orders.

2.7 Why the old playbook stopped working

Fiverr's trajectory is a steady migration from **gameable volume signals to unobservable satisfaction signals**. Early Fiverr ranked largely on conversion rate and order volume. The 2024 overhaul replaced monthly evaluation with daily evaluation, introduced the Success Score, added a 30-day grace period, made scoring peer-relative, and moved the heaviest weight onto private feedback that sellers never see. The 2025–26 layer added AI-assisted matching and brief routing gated on Success Score.

The practical consequence: tactics built on producing transaction volume have declining and eventually negative returns, because they dilute the exact signals that now carry the most weight — new-buyer satisfaction, order value, and dispute-free delivery.

The Operating Model

The system that produces the score. Five layers, one order lifecycle.

3.1 Architecture

LAYER	OWNER	FUNCTION	PRIMARY METRIC
Strategy	Ash	Ratio policy, pricing, gig portfolio, escalation authority	Success Score
Operations	Hasnain (Lead)	Shift handoff, SLA enforcement, QA gate before delivery	Impressions, cycle time
Execution	Shift CSRs	Inquiry response, intake, mid-order checkpoint, delivery	Close rate, on-time %
Monitoring	Hasnain	Daily board, log reconciliation, cancellation watch	Completion ratio
Optimisation	Ash, weekly	Ratio tuning, follow-up recovery, gig launches	Impressions trend

3.2 The order lifecycle — twelve controlled steps

- 1 First response • within 30 minutes**
Qualify before quoting. Never quote a price before understanding scope. Report spam as spam within 24 hours to protect response rate.
- 2 Qualification**
Budget range, deadline, and decision-maker confirmed before any custom offer is sent.
- 3 Offer sent • logged with price**
Every quoted price is written into the inquiry sheet the moment it is sent. No exceptions.
- 4 Follow-up 1 • day 1**
Logged in the FollowUp column with a date. An inquiry cannot be closed without three logged touches.
- 5 Follow-up 2 • day 3**
Different angle: address the likely objection, not a repeat of the offer.
- 6 Follow-up 3 • day 7**
Final touch. Only now may the lead be marked closed, with a reason code.
- 7 Order start • intake within 15 minutes**
The 12-question script from 3.3, posted in order chat as a single numbered block.
- 8 Scope lock confirmed in writing**
Client confirms the deliverable list before design work begins. This is question 11 and it is non-negotiable.

9**First concepts • within 48 hours**

Regardless of package deadline. Category median is 2–3 days; the urgency signal rewards speed.

10**Mid-order checkpoint • at 50% elapsed**

Send direction and ask plainly whether anything needs changing. This is where a silent 3-star private rating becomes a fixed order.

11**QA gate before delivery**

Every file checked against the question-11 list. Watermarks removed. Fonts noted. Owned by the Ops Lead, not the designer.

12**Delivery at 60% of promised time**

If the gig says 5 days, deliver on day 3. Then request the review and explain that both a public and a private review will be requested.

3.3 The intake script

Gig requirements cannot currently be edited, so this runs in **order chat within 15 minutes of order start**. Functionally equivalent for scoring purposes: Success Score measures the order experience, not the requirements form. Post as one numbered block and ask the client to reply inline.

BRAND BASICS

- 1 Exact brand name as it should appear, including capitalisation. Any tagline?
- 2 What does your business actually do, in one or two sentences?
- 3 Who is your customer? Age, market, price level.

DIRECTION

- 1 Send 3 logos you like — any industry — and one line on what you like about each.
- 2 Send 1 logo you actively dislike, and why.
- 3 Icon plus text, text only, or open to both?
- 4 Any colours that must be used, or must be avoided?

CONSTRAINTS

- 1 Where will this be used most? Website, packaging, signage, app icon, print?
- 2 Anything that must appear in the mark — a specific object, letter or symbol?
- 3 Is there an existing logo we are replacing? Send it.

SCOPE LOCK — THE ONE THAT PROTECTS THE SCORE

- 1 Confirming your package includes: *[list every file and asset by name]*. Is anything you expected missing from that list?
- 2 Your delivery date is *[date]*. Does that work, or do you need it sooner?

WHY QUESTION 11 EXISTS

One of your visible 4.7 reviews cites missing files and a watermark left on a social media cover. A sheet annotation records a cancellation caused by a client who did not know an editable file requires the font installed locally. Both failures hit **quality of delivery and value of delivery simultaneously** — the exact two sub-ratings holding you at 4.8. Confirming the deliverable list in writing before work starts kills the complaint and hands the QA gate a checklist.

3.4 Delivery service levels

CHECKPOINT	STANDARD	ESCALATION TRIGGER
First response to inquiry	30 minutes	Over 2 hours → shift lead
Intake posted after order start	15 minutes	Over 1 hour → shift lead
First concepts to buyer	48 hours	Over 72 hours → Ash
Mid-order checkpoint	50% elapsed	Missed → logged as defect
Final delivery	60% of promised window	Over 100% → Ash, same day
Any order age	7 days	Hard escalation to Ash
Any cancellation risk	—	Ash before it is filed, always

3.5 The follow-up engine

No inquiry may be closed as "Not Placed" until FollowUp 1, 2 and 3 carry dates. A CSR who marks a lead dead without three logged touches has it reopened and reassigned.

Hi [name], following up on the [service] we discussed on [date].

The quote we shared was [price] and that is still open.

If the timing was wrong, tell me when to check back.

If the budget was the issue, tell me your number and I will see what I can put together.

Start with the four largest dead leads: selmaprof at \$950, bobzinos at \$900, getgwoppa at \$700, and farida_ism at \$700. A 15% recovery across the full \$5,472 is \$820 — more than a full day of current revenue, for zero ad spend and no new traffic.

3.6 Ratio policy

METRIC	NOW	TARGET BY 10 AUG	RATIONALE
Inorganic share of orders	74%	≤ 30%	Matches Dygram, the profile in your portfolio that recovered
Cancellations per month	6 in 19 days (peak)	0	A directly scored Success Score area
Average order value	\$147 organic / \$77 inorganic	\$150+ blended	Higher-value orders carry more scoring weight
Cycle time	4–12 days	under 5 days	Peer-relative delivery speed feeds the score

Team Model

Roster, leader, coverage, ownership and the training system.

4.1 Attributed performance, June–July 2026

CSR	INQUIRIES	PLACED	CLOSE RATE	REVENUE	READ
Hasnain	13	3	23%	\$505	Only performer with volume and conversion
Amrah	4	0	0%	\$0	Almost no volume touched
Nadir	2	0	0%	\$0	Owens the highest-value window, touched two leads
Zaheen	0	0	—	\$0	No record on this profile at all
Roster total	19	3	16%	\$505	—

THIS IS AN OWNERSHIP FAILURE, NOT A PERFORMANCE FAILURE

Hasnain handled 68% of the roster's XStudioz volume and produced 100% of its revenue. Amrah, Nadir and Zaheen logged **six inquiries between them in two months**. That is not three underperforming people — that is a profile nobody was assigned to properly, absorbed by whoever happened to be online. Fix assignment before you judge anyone's numbers.

4.2 Leader designation

Hasnain becomes Operations Lead for XStudioz, effective immediately, provisionally. He is the only roster member with meaningful volume and the highest close rate at that volume, and he handled the client who left a five-star review praising quality and delivery in the most recent period.

Confirm or reverse after 14 days against the scorecard in 4.5. Two things the scoreboard will not show you, and which matter more than any number on it:

- Who flags their own mistakes before you find them.
- Who fixes another person's order without being asked.

His owned deliverable: the QA gate. Nothing ships to a client without a check against the question-11 deliverable list. That is a real job with a real number attached, not a title.

4.3 Coverage map and the structural gap

PKT WINDOW	ON DUTY	UK TIME	US EASTERN	DEMAND VALUE
09:00 – 11:00	Amrah + Zaheen	05:00 – 07:00	00:00 – 02:00	Low
11:00 – 17:00	Amrah + Zaheen + Ash	07:00 – 13:00	02:00 – 08:00	UK morning — good
17:00 – 21:00	Hasnain + Ash	13:00 – 17:00	08:00 – 12:00	UK afternoon, US ramp
21:00 – 01:00	Hasnain + Nadir + Ash	17:00 – 21:00	12:00 – 16:00	Strong
01:00 – 09:00	Nadir alone	21:00 – 05:00	16:00 – 00:00	Peak US — highest value

Your review base is UK, USA, Australia, Canada, UAE and Germany. Two people cover the lowest-value window; one person covers eight hours of peak US and UK-evening demand alone — and logged two inquiries in two months. That mismatch is the most expensive structural error in the current setup.

ON COVERING NIGHTS YOURSELF

Adding night presence on top of a 12-hour shift makes you the redundancy layer for a four-person team. That holds for roughly three weeks before something breaks, and what usually breaks first is delivery quality — the exact metric you can least afford to drop right now. Treat it as a two-week bridge while Hasnain is stood up, not as the fix.

4.4 Ownership matrix

PERSON	OWNS OUTRIGHT	REPORTS DAILY
Ash	Success Score · ratio policy · pricing · escalations	Nothing. Reviews everything.
Hasnain (Lead)	QA gate · shift handoff · log reconciliation	Completion ratio, impressions
Amrah + Zaheen	Response rate · UK/Europe window conversion	First-response time, close rate
Nadir	US window booked revenue	Revenue booked in shift

4.5 The scorecard — published daily, everyone sees everyone

METRIC	DEFINITION	STANDARD
First-response speed	Minutes to first reply on a new inquiry	Under 30 minutes
Intake completeness	% of orders where all 12 questions were answered before work began	100%
Checkpoint compliance	% of orders where the 50% check message was sent	100%
Follow-up compliance	% of closed leads with 3 logged touches	100%
Revenue booked	Value of orders closed in that shift	Tracked, ranked

4.6 Training curriculum — four competencies

1

Inbox conversion

Reply within 30 minutes. Qualify before quoting. Never quote before understanding scope. Teach the response-rate rule explicitly — first message only, 24-hour window, rolling 90 days, spam reportable within 24 hours. Most agencies bleed this metric on messages they could have flagged instantly.

2

Requirement extraction

The CSR who asks the best questions produces the highest Success Score. Score on brief completeness, never on message volume.

3

Mid-order checkpoint discipline

Binary weekly check: was a draft sent and feedback requested before final delivery? This single habit converts silent private-rating damage into fixed orders.

4

Dispute avoidance

Conflict-free orders is a scored area. Every dispute gets a written post-mortem, filed and reviewed weekly. Patterns get turned into intake questions.

DECLINE POLICY — CURRENTLY MISSING

Your inquiry log contains CSRs declining clients with notes such as "low budget", "do not want to work" and "order nhi lena". Some of that is correct qualification. Some of it is a CSR setting your pricing strategy at 2am with no rule to follow. **Write the rule: below what number do you decline, and who is permitted to.** Until then, that decision is being made inconsistently by four people.

The 33-Day Plan

28 July to 30 August 2026. Two phases, one hard gate between them.

Phase 1 · 28 July – 10 August · Signal repair

Objective: stop the damage. Do not attempt to grow the queue. Do not spend on ads.

#	ACTION	OWNER	STANDARD
1	Cancellations to zero — every risk escalated to Ash before filing	Ash	Zero, no exceptions
2	Inorganic share cut to 30% or below	Ash	Measured weekly
3	12-question intake live on every order	All CSRs	100% compliance
4	First concepts within 48 hours; delivery at 60% of window	Hasnain	100%
5	QA gate against deliverable list before every delivery	Hasnain	100%
6	Work the \$5,472 dead pipeline, largest first	Hasnain	19 leads touched
7	Follow-up columns mandatory before any lead is closed	All CSRs	3 touches logged
8	Reconcile inquiry log against tracker every day	Hasnain	Numbers must match
9	Turn on Request to Order (already included in Seller Plus Premium)	Ash	Day 1
10	Move a second person into the 01:00–09:00 PKT window	Ash	Week 1

GATE – DO NOT PROCEED TO PHASE 2 UNTIL ALL THREE ARE TRUE

- **Success Score reads 9** on the Level Overview page.
- **Seven-day average impressions above 4,000.**
- **Five consecutive days** where orders completed ÷ orders received is at or above 1.0.

Phase 2 · 10 – 30 August · Controlled scale

#	ACTION	DETAIL
11	Fiverr Ads at \$30/day on the branding kit gig	At 12% conversion and \$118 net per organic order, cost-per-order lands at 7–14% of net — comfortably inside the 20% viability threshold. Scale weekly on measured cost-per-order only.
12	Launch gigs in thinner subcategories	Brand style guides, business cards and stationery, packaging and label design. Fiverr's own guidance names logo design as saturated and recommends this exact move.
13	Assign brief response ownership per shift	Success Score 7+ keeps you inside the brief routing flow. Thirty-minute SLA, named owner.
14	Push average order value through tiers and extras	Source files, brand guidelines, social kits. Higher-value orders carry more scoring weight.
15	Track unique clients as a weekly KPI	Repeat orders do not count toward the unique-client gate.

Where this lands on 30 August

METRIC	27 JULY	30 AUGUST TARGET
Daily impressions	1,564	6,000 – 8,000
Success Score	8	9
Queue depth	25 – 30	40 – 45
Cycle time	4 – 12 days	under 5 days
Inorganic share	74%	≤ 30%
Cancellations	6 in peak 19 days	0
Top Rated status	Blocked on Success Score	Submitted for review

Not queue 65. That target implies a 32-day cycle time at current visibility and would reproduce, on every order, the conditions that generated your worst review.

Metrics and Cadence

What gets measured, by whom, how often.

6.1 The one number

POST THIS EVERY MORNING AT 09:00 PKT

Impressions — today, and the seven-day rolling average.

Not orders. Not queue. Impressions is the only metric that tells you whether the suppression is lifting. Everything downstream follows it. When the seven-day average crosses **4,000**, the recovery is real and Phase 2 opens.

6.2 The daily board

METRIC	SOURCE	OWNER	ALARM
Impressions + 7-day average	Fiverr analytics	Hasnain	7-day avg falling
Completion ratio — completed ÷ received	Tracker	Hasnain	Below 1.0
Success Score per gig	Level Overview	Ash	Any drop
Cancellations	Tracker	Ash	Any at all
Orders past day 7	Order list	Hasnain	Any at all
Inorganic share, rolling 7 days	Tracker	Ash	Above 30%
Log reconciliation — tracker vs inquiry sheet	Both	Hasnain	Any mismatch

6.3 Shift handoff — five lines, every changeover

1. Open orders and their deadlines
2. Unanswered first-messages
3. Orders at risk (past day 5, revision loops, unhappy tone)
4. Escalations needing Ash
5. Revenue booked this shift

6.4 Weekly review — Ash, 30 minutes

- Impressions trend versus the previous week. This is the verdict on everything else.
- Success Score per gig, expanded to see which of the six areas moved.

- Scorecard ranking across the four CSRs.
- Dead pipeline recovered, in dollars.
- Every dispute post-mortem from the week, and what intake question would have prevented it.

6.5 Kill criteria — when to stop and rethink

CONDITION	RESPONSE
Impressions still under 2,000 on 20 August with all Phase 1 actions at 100%	The cause is not in your control set. Stop spending effort here; shift volume weighting to Dygram and Storm and treat XStudioz as a rebuild.
Success Score falls to 7	Stop all inorganic immediately. Below 7 you lose brief routing entirely.
Any cancellation during Phase 1	Full post-mortem the same day, before the next order is accepted.
Completion ratio below 1.0 for five straight days	Stop accepting new orders on the branding kit gig until the queue drains.

Constraints and Idle Levers

What you have said you cannot do, what that costs, and what is sitting unused.

7.1 Stated constraints and the workaround

CONSTRAINT	WHAT IT BLOCKS	WORKAROUND IN THIS MODEL
Cannot edit existing gigs	Order requirements, delivery times, copy, pricing tiers	Intake moves to order chat. Delivery time becomes an internal SLA rather than an advertised one.
Cannot change shift structure	Fixing the 01:00–09:00 solo window	Ash bridges for two weeks. Second person moved in as soon as possible. Treated as temporary.
Cannot create a Team Account	Legitimate multi-person access under one login	No workaround. Note that four people on one password across four devices is the exact pattern platform integrity systems look for.
Will not use the AI Personal Assistant	Response-rate credit and the buyer-side filter that gives gigs with active assistants prioritised visibility	None. Accepted cost, recorded here so the decision is deliberate.

7.2 Idle levers — the largest is gig slots

SEVEN EMPTY GIG SLOTS

Level 2 permits ten gigs. XStudioz runs three. The appearance of **X_Studioz new gig** in the tracker from 20 July proves you *can* create gigs even though you cannot edit existing ones.

But note its impressions: 139, 17, 18, 9, 10, 6, 3, 8. A new gig on a healthy profile receives a visibility window in its first 48 to 72 hours. This one received almost nothing — **further evidence the suppression sits at profile level, not gig level**. Launching more gigs will not fix it until the profile signal recovers. Hold new launches until Phase 2.

LEVER	STATUS	ACTION
Request to Order	Paid for, not switched on	Turn on today. Forces buyers to message first, letting you qualify before a bad-fit order touches your metrics.
Seller Plus keyword research	Paid for, unused	Use it to select subcategories for Phase 2 gig launches.
Fiverr Ads	Eligible, not running	Gate behind Phase 2. Maths is favourable; timing is not.
Seven gig slots	Idle	Phase 2 only, in thinner subcategories.
1,583-review trust asset	Underexploited	Highest-converting profile in the portfolio by rating. Deserves the highest-value order mix, not the lowest.

7.3 The strategic note on order mix

In September 2025, XStudioz ran 100% organic at \$138.61 average order value — the highest in the portfolio at that time, above Grid Designs at \$67–98. It is your **premium-average-order-value profile**. In July 2026 it carried 74% inorganic at \$77 per order.

Set aside every other consideration and the mechanics alone argue against this: Fiverr weights higher-value and more recent orders more heavily in Success Score, and weights private ratings from **new buyers** most heavily of all. Loading a premium profile with low-value controlled volume dilutes the highest-weighted signal in the model, on the one profile that is a single point away from Top Rated. That is the leverage argument, independent of any other.

Sources and Method

Where each class of claim comes from.

Platform mechanics

- Fiverr Help Center — Success score (six scored areas, weighting, peer-relative scoring, edge cases)
- Fiverr Help Center — Fiverr's level system (thresholds, daily evaluation, 30-day grace, gig slots)
- Fiverr Help Center — Fiverr's search and recommendation system (ranking inputs, availability, urgency, pricing)
- Fiverr Help Center — Response time and rate (first-message rule, 24-hour window, 90-day roll, spam handling)
- Fiverr Help Center — Repeat business score (subcategory-relative, 90-day, badge threshold)
- Fiverr Help Center — Personalized offers / Briefs (Success Score 7+ routing gate)
- Fiverr Help Center — Reviews and ratings, Team Account, Community Standards
- Fiverr Community blog — private ratings mechanics and weighting; Success Score peer-relativity; delivery-time and order-requirement guidance from Fiverr customer success managers

Profile and portfolio data

- Public profile [fiverr.com/x_studioz](https://www.fiverr.com/x_studioz) as at 27 July 2026 — level, rating, review count, sub-ratings, star distribution, gig set, observed order durations and values
- Daily Data Sheet — Profiles, 9 September 2025 to 27 July 2026 — impressions, clicks, organic and inorganic order counts and values, completions, queue, click ratio, conversion rate, cancellations, Success Score, profile rating, across all eleven profiles
- Client Daily Inquiries — X Studioz, January to July 2026 — approximately 330 rows covering client, country, status, quoted price, shift, CSR and note

Method notes and known limitations

- Monthly averages exclude days with no logged entry rather than treating them as zero.
- Inorganic share is calculated as inorganic orders divided by total orders for the period.
- CSR attribution exists only from June 2026; no earlier attribution is possible from this data.
- Two CSR names appearing in the log have been excluded at your instruction as their profile assignments are changing.
- **Causation is not established.** The cancellation cluster and the inorganic ratio spike occupy the same window and cannot be separated with this dataset. Both are treated as candidate causes with an overlapping remedy set.
- The inquiry log and the order tracker disagree materially for July. Conversion figures drawn from the inquiry log should be treated as indicative until the two are reconciled.

REVIEW DATE

This model assumes conditions as at 27 July 2026. Re-run the impressions series and the Success Score reading on **10 August** at the Phase 1 gate, and again on **30 August**. If the seven-day impression average has not moved by 10 August with Phase 1 actions at full compliance, the diagnosis in Part 1 is wrong and the kill criteria in 6.5 apply.
